this edited volume highlights the scientific contributions of volker mehrmann a leading expert in the area of numerical linear algebra matrix theory differential algebraic equations and control theory these mathematical research areas are strongly related and often occur in the same real world applications the main areas where such applications emerge are computational engineering and sciences but increasingly also social sciences and economics this book also reflects some of volker mehrmann s major career stages starting out working in the areas of numerical linear algebra his first full professorship at tu chemnitz was in numerical algebra hence the title of the book and matrix theory volker mehrmann has made significant contributions to these areas ever since the highlights of these are discussed in parts i and ii of the present book often the development of new

algorithms in numerical linear algebra is motivated by problems in system and control theory these and his later major work on differential algebraic equations to which he together with peter kunkel made many groundbreaking contributions are the topic of the chapters in part iii besides providing a scientific discussion of volker mehrmann's work and its impact on the development of several areas of applied mathematics the individual chapters stand on their own as reference works for selected topics in the fields of numerical linear algebra matrix theory differential algebraic equations and control theory

this volume contains the proceedings of the conference on interactions of classical and numerical algebraic geometry held may 22-24 2008 at the university of notre dame in honor of the achievements of professor andrew j sommes while classical algebraic geometry has been studied for hundreds of years numerical algebraic geometry has only recently been developed due in large part to the work of andrew sommes and his collaborators the intersection of these two fields is now ripe for rapid advancement the primary goal of both the conference and this volume is to foster the interaction between researchers interested in classical algebraic geometry and those interested in numerical methods the topics in this book include but are not limited to various new results in complex algebraic geometry a primer on seshadri constants analyses and presentations of existing and novel numerical homotopy methods for solving polynomial systems a numerical method for computing the dimensions of the cohomology of twists of ideal sheaves and the application of algebraic methods in kinematics and phylogenetics

a classroom tested alternative approach to teaching math for liberal arts puzzles paradoxes and problem solving an introduction to mathematical thinking uses puzzles and paradoxes to introduce basic principles of mathematical thought the text is designed for students in liberal arts mathematics courses decision making situations that progress from recreational problems to important contemporary applications develop the critical thinking skills of non science and non technical majors the logical underpinnings of this textbook were developed and refined throughout many years of classroom feedback and in response to commentary from presentations at national conferences the text's five units focus on graphs logic probability voting and cryptography the authors also cover related areas such as operations research game theory number theory combinatorics statistics and circuit design the text uses a core set of common representations strategies and algorithms to analyze diverse games puzzles and applications this unified treatment logically connects the topics with a recurring set of solution approaches requiring no mathematical prerequisites this book helps students explore creative mathematical thinking and enhance their own critical thinking skills students will acquire quantitative literacy and appreciation of mathematics through the text's unified approach and wide range of interesting applications
